

## *Wabamun Formation, Central Alberta Project*

Townships 30 - 50  
Ranges 14W4 - 8W5M

Ward Hydrodynamics Ltd. has completed a major hydrodynamic evaluation of the Wabamun Formation in central Alberta. This evaluation defines the regional carbonate banks, the recent Stettler/Nevis gas/oil play and a **potential new regional deep basin gas trend**. It also defines many possible pool extensions and over 75 potentially by-passed zones.

The evaluation consists of a text and a suite of maps. The text documents the interpretations and provides a compilation of the DST, production test and fluid chemistry data. Maps include a pool delineation map, pressure versus elevation graphs, a potentiometric surface map, a methane content map, a hydrogen sulphide map and a water chemistry map.

### *Availability and Cost*

\$25,000.00 plus GST

Delivery: June 15, 2006
