

Rock Creek and Nordegg Formations

Townships 50 - 60
Ranges 12 - 20W5M

Ward Hydrodynamics is pleased to announce the immediate availability of two new deep basin projects in west central Alberta. The separate evaluations of the Rock Creek and Nordegg Formations defines their deep basin edges, reservoir continuities and effective permeabilities. Both evaluations define major undeveloped gas trends, including over 20 pool extensions and 27 potentially by-passed zones.

An important discovery was made in the Nordegg Formation, with the definition of a western deep basin, which holds significant undeveloped gas producing potential. For the Rock Creek, a westerly continuation of the highly productive deep basin was defined.

Each evaluation includes a technical report and map suite. The technical report documents the reservoir continuities, fluid chemistries and new play concepts. It also includes a complete compilation of all the drill stem tests, production tests, and fluid chemistries. The map suite consists of a PIE graph and pool delineation map which illustrates the pools, permeabilities and new play concepts.

Availability and Cost

Rock Creek: \$15,000.00 plus GST
Nordegg: \$15,000.00 plus GST
Both Studies: \$22,500.00 plus GST
